GROUP 6 · IDEA PROPOSAL

NudgeWell

An opt-in coach that estimates when you **want to put your phone down but probably won't** — and offers a brief alternative you chose.

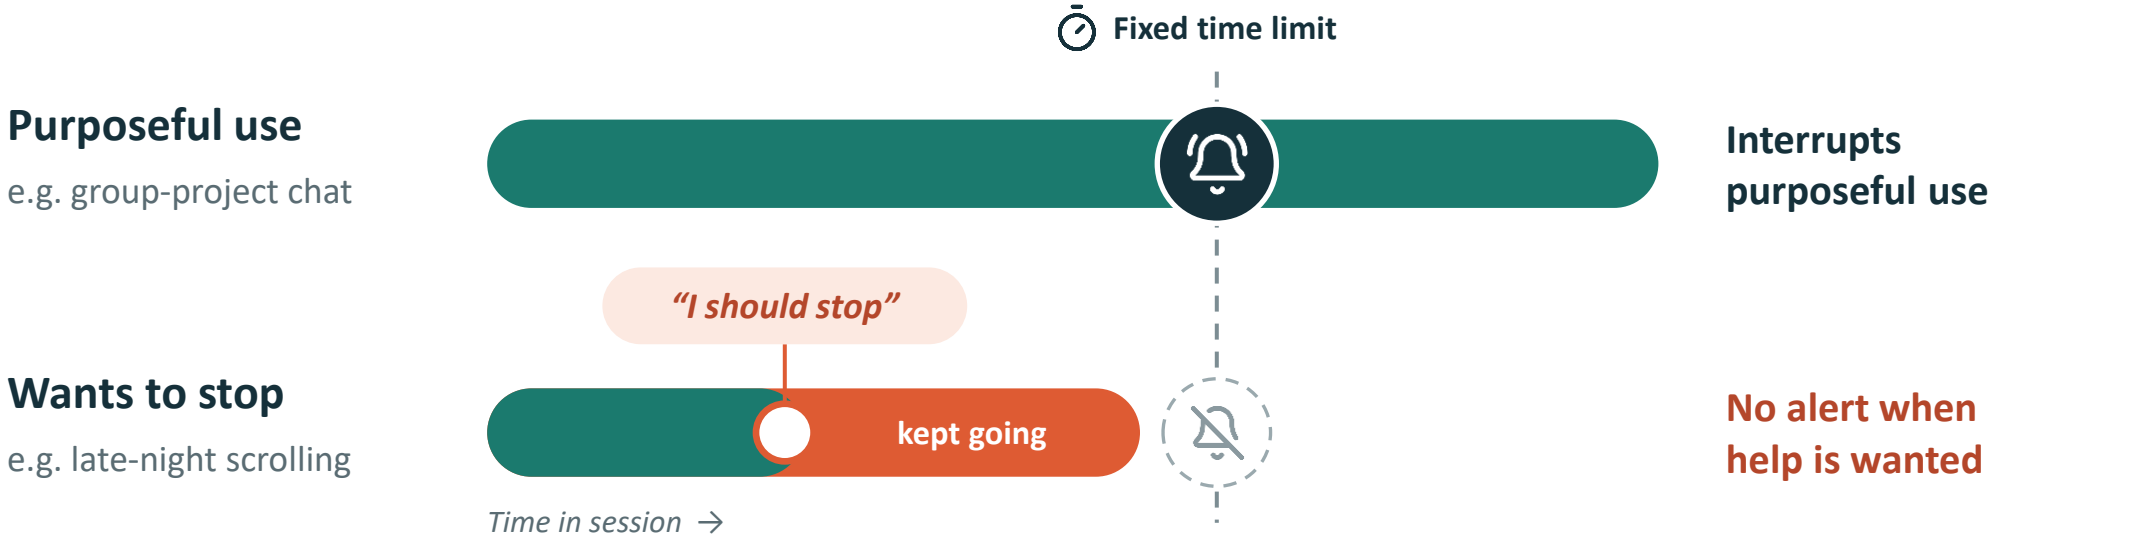

Concept mock-up

Digital Addiction Capstone · 24 September 2026

02 · THE PROBLEM

Time limits miss the moment that matters

The intention–behavior gap

Within one session, you feel you should stop, yet keep using the phone. That moment, not total screen time, is our target.

14.9%

of AwareMind check-ins leaned toward "stop", yet phone use went on for over 5 minutes

Source: Zheng & Choe (2026), arxiv.org/html/2609.08909v1 · 14.9% uses the paper's example cut-offs: rating below 5.5 of 10 and over 5 minutes of further use.

03 · OUR PROPOSED SOLUTION

A coach that speaks up only when confident

01

Opt in

Pick a few alternatives you enjoy: a walk, a stretch.

02

Read context

Only what's known so far: time, app type, minutes used, taps, past sessions.

03

Estimate the gap

How likely you are to want to stop, yet keep going.

04

Offer a choice

Only if confident: one brief idea from your list. Dismiss in one tap.

Guardrails

- ✓ Opt-in only
- ✓ Quiet by default
- ✓ Dismiss anytime
- ✓ Not a diagnosis or treatment

Proposed Android research prototype. Whether suggestions help would need a later user study.

AwareMind records both halves of the gap

AwareMind · Zheng & Choe (2026)

5,772
in-the-moment check-ins

37
adult Android users

2+
weeks per person

SAID
“I should ___ using my phone now”
Mid-session pop-up · 1 = stop … 10 = continue

+

DID
Minutes of phone use after answering
Measured until the screen locked

=

GAP
Said “stop”, kept going → large gap
What we predict, session by session

How we’ll test it

1. **Only pre-outcome inputs**
   Never the survey answer or later use
2. **Baselines vs. a small temporal model**
   Simple average + the paper’s random forest
3. **Test on unseen people**
   MAE, R^2, precision–recall, alert burden

If a simpler model wins, we report it.

Limits & scope
37 people: results may not generalize
Data-reuse permission still to confirm
Not CMI data: person-level risk, no session labels
